Application notes

Application Note : February 2019

Market involved : Distribution

Product : SCTL55 smart configurator

Customer : Distributors

Subject : Stock reduction thanks to easy configuration of the sensors

CUSTOMER ISSUE :

A distributor generally keeps several versions of the product on stock, in order to be able to meet the requests in a short time.

Usually the items to be kept on stock are based on the ones that are more often requested, but the customer should need other variants that are not included in this range, this leads to a long delivery time.

The target of the distributor is to reduce the stock and to provide all variants requested by customers in a few days.

OUR SOLUTION :

The SCTL55 Smart Configurator, in combination with the IO-Link inductive and capacitive sensors, offers the perfect solution for the distributor.

By using the new SCTL55, the distributor selects a few items for each mechanical variant of the IO-Link enabled sensor.

For instance, for an M12 inductive he will keep in stock a few pieces for short or long body, flush or non-flush, plug or cable.

All these sensors will be delivered pre-programmed with the most common output version: PNP, NO.

When different configurations are required, it is possible to modify the sensors in a few steps, just connecting the sensor to the SCTL55.

BENEFITS :

- Significant stock reduction
- Delivery time for any special version reduced to one day
- Easy programming of the sensor by setting the preferred parameters in the favourite selection session on the "Configure" App home page
- Excellent customer service
